

Human and animal remains: a comparative approach

An intensive two-day course for professionals, students and enthusiasts of bioarchaeology and forensic sciences.

15th - 16th September 2016

This short course will focus on a comparison between human and other animal remains. By using both macroscopic and microscopic analyses along with an insight into biomolecular investigations, the course will illustrate some basic tools used in distinguishing human remains from those of other animals. Different methodologies and research approaches that characterise the different disciplines of human osteoarchaeology, zooarchaeology and forensic science will be discussed. This multidisciplinary approach will make use of short lectures, hands-on practical activities and case studies.
